Amendments to the Specification:

On page 9 commencing at line 20, please amend paragraph as follows:

The output pseudo language characters are entered into the application under test and displayed as indicated at 18. In a presently preferred embodiment, the pseudo language characters 18 as shown in the figure are graphically recognizable as English characters distinguishable from the pseudo language characters, and are shaped to conform similarly to the language used by the operator, such as English. Thus, the output shown at 18 is recognizable by the tester as having English language characters. The tester can thereby insert a plurality of pseudo language multibyte characters for testing, especially initial testing, and be able to confidently view the results knowing whether the characters are correctly produced or not since the pseudo language characters 18 as shown in the figure are also graphically recognizable as Chinese characters. In this manner, multibyte character set data can be thoroughly tested in the application.
